

Crop: Hot pepper (*Capsicum frutescens*) – EPPO Code: CPSFR

Pathogen: *Leveillula taurica* (Pepper powdery mildew) - EPPO Code: LEVETA

**

Suggested control Measures:

Symptoms:

White powdery fungal growth on the undersides of leaves that may enlarge and coalesce to cover the entire leaf surface. Light green, yellow, or brown discoloration on the upper leaf surface. Upward curling of infected leaves and premature leaf dropping expose the fruits to sun scorching.

Management practices:

Good agricultural practices:

- Growing pepper on well-drained soils with optimum air circulation;
- Adjust plant density and row orientation for better air circulation

Other practices

- Use resistant varieties (when available)
- Fungicides including azoxystrobin
- Integrating more than one of the above-mentioned options in addition to the removal of volunteer plants and residues in and around the field may provide effective, economical and sustainable pepper powdery mildew management
